

Python-Numpy

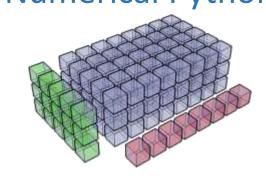

Dr. Sarwan Singh

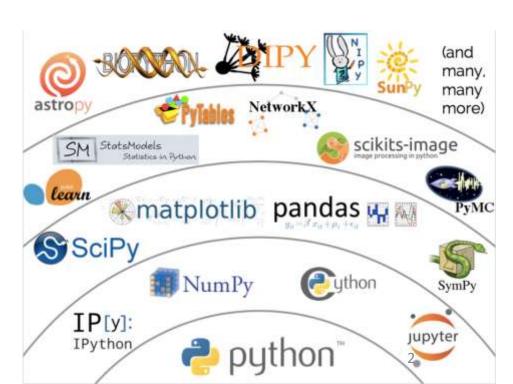

Agenda

NumPy Numerical Python NumPy

- Introduction
- History, usage
- Universal Functions
- Indexing, Slicing and Iterating
- Stacking -splitting arrays
- Broadcasting
- Reading from csv files

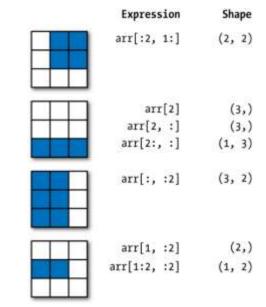

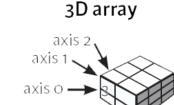

Introduction

- Numerical Python (Numpy) has greater role for numerical computing in Python.
- It provides the data structures, algorithms, and library glue needed for most scientific applications involving numerical data in Python.
- It has fast and efficient multidimensional (N-dimensional) array object ndarray
- Functions for performing element-wise computations with arrays or mathematical operations between arrays
- It has tools for reading and writing array-based datasets to disk

Introduction

5

- It is useful for Linear algebra operations, Fourier transform, and random number generation
- It has sophisticated (broadcasting) functions
- It has tools for integrating C/C++ and Fortran code
- It provides an efficient interface to store and operate on dense data buffers
- NumPy arrays form the core of nearly the entire ecosystem of data science tools in Python
- Besides its obvious scientific uses, NumPy can also be used as an efficient multidimensional container of generic data. Arbitrary data-types can be defined. This allows NumPy to seamlessly and speedily integrate with a wide variety of databases.

 Shape: (3, 2) Shape: (2,) Shape: (3, 2)
- NumPy is licensed under the <u>BSD license</u>

History

• **NumPy** derives from an old library called Numeric, which was the first array object built for Python. (written in 2005 launched in 2006)

Numeric was quite successful and was used in a variety of

applications before being phased out.

Jim Fulton

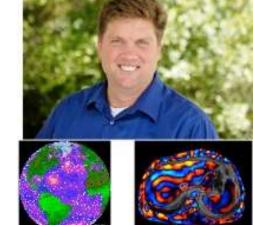

Person	Package	Year
Jim Fulton	Matrix Object in Python	1994
Jim Hugunin	Numeric	1995
Perry greenfield, Rick white, Todd Miller	Numarray	2001
Travis Olipant	NumPy	2005 5

Travis Oliphant - CEO

- PhD 2001 from Mayo Clinic in Biomedical Engineering
- MS/BS degrees in Elec. Comp. Engineering
- Creator of SciPy (1999-2009)
- Professor at BYU (2001-2007)
- Author of NumPy (2005-2012)
- Started Numba (2012)
- Founding Chair of Numfocus / PyData
- Previous PSF Director

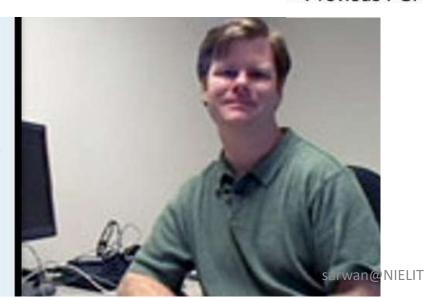

NumPy

Jim Hugunin

Jim Hugunin brought his Python skills to Microsoft in 2004 and he left in October 2010 to work for Google. Hugunin delivered IronPython, an implementation of Python for .NET, to Microsoft and helped build the Dynamic Language Runtime. In a notice, he said Microsoft's decision to abandon investment in IronPython led to his decision to leave the company.

- NumPy's main object is the homogeneous multidimensional array. It is a table of elements (usually numbers), all of the same type, indexed by a tuple of positive integers.
- In NumPy dimensions are called axes.
- NumPy defines N-dimensional array type called ndarray(also known by the alias array). It describes the collection of items of the same type. Items in the collection can be accessed using a zero-based index.
- numpy.array is not the same as the Standard Python Library class array.array, which only handles one-dimensional arrays.

rwan@NIELIT

Syntax

numpy.array(

```
object,
dtype = None,
copy = True,
order = None,
subok = False,
ndmin = 0
```

```
import numpy as np
a = np.array([2,3,4])
array([2, 3, 4])
print("Shape : " ,a.shape )
print("Size : " ,a.size )
print("Datatype : " ,a.dtype )
             : " ,a.ndim )
print("ndim
Shape
        : (3,)
Size
Datatype: int32
ndim
```

```
dtype: Desired data type of array, optional
```

copy: Optional. By default (true), the object is copied

order: C (row major) or F (column major) or A (any) (default)

subok: By default, returned array forced to be a base class array. If true, sub-classes passed through

ndmin: Specifies minimum dimensions of resultant array

```
aa=np.array( [ [1,2,3,4],[5,6,7,8] ])
aa
array([[1, 2, 3, 4],
       [5, 6, 7, 8]]
print("Shape
               : " ,aa.shape )
               : " ,aa.size )
print("Size
print("Datatype :
                   ,aa.dtype )
               : " ,aa.ndim )
print("ndim
Shape
        : (2, 4)
Size
Datatype: int32
ndim
        : 2
```

```
a = np.array(1,2,3,4) # WRONG
```

- a = np.array([1,2,3,4]) # RIGHT
- The function zeros creates an array full of zeros,
- the function ones creates an array full of ones,
- the function empty creates an array whose initial content is random and depends on the state of the memory.
- By default, the dtype of the created array is float64.
- np.ones((2,3,4), dtype=np.int16)
- np.zeros((3,4))
- np.empty((2,3))

```
a2 = np.array([1, 2, 3, 4], ndmin = 2)
print("Array
                : ",a2)
                : " ,a2.shape )
print("Shape
                : " ,a2.size )
print("Size
print("Datatype : " ,a2.dtype )
               : " ,a2.ndim )
print("ndim
         : [[1 2 3 4]]
Array
Shape
         : (1, 4)
Size
Datatype:
           int32
ndim
            aa
            array([[1, 2, 3, 4],
                    [5, 6, 7, 8]])
            aa[1,3]
            8
            aa[1]
            array([5, 6, 7, 8])
            aa[1,3]=20
             aa
            array([[ 1, 2, 3, 4], [ 5, 6, 7, 20]])
```

 When you print an array, NumPy displays it in a similar way to nested lists

```
a = np.arange(6) # 1d array
print(a)
[0 1 2 3 4 5]
b = np.arange(12).reshape(4,3) # 2d array
print(b)
[[0 1 2]
 [3 4 5]
 [6 7 8]
 [ 9 10 11]]
c = np.arange(24).reshape(2,3,4) # 3d array
print(c)
[[[0 1 2 3]
 [4 5 6 7]
 [8 9 10 11]]
[[12 13 14 15]
 [16 17 18 19]
  [20 21 22 23]]]
```

Basic Operations

```
• * , + , += , *=
```

• Dot

```
A=np.arange(4).reshape(2,2)
B=np.array([[4,5],[6,7]])
print("A \n",A,"\n B\n",B, "\nA+B\n", A+B)
Α
[[0 1]
              # elementwise product
 [2 3]]
              print("A \n",A,"\n B\n",B, "\nA*B\n", A*B)
[[4 5]
 [6 7]]
              [[0 1]
A+B
              [2 3]]
[[ 4 6]
 [ 8 10]]
               [[4 5]
              [6 7]]
              A*B
              [[ 0 5]
              [12 21]]
              # matrix product
              print("A \n",A,"\n B\n",B, "\nA*B\n", A.dot(B) )
              [[0 1]
              [2 3]]
              [[4 5]
              [6 7]]
              A*B
              [[ 6 7]
               [26 31]]
```

- numpy.arange(start, stop, step, dtype)
- numpy.linspace(start, stop, num, endpoint, retstep, dtype) - the number of evenly spaced values between the specified interval

```
print("A \n",A)
  print("B \n",B)
  print("A.max " , A.max())
  print("A.min " , A.min())
  print("A.sum " , B.sum())
   [[0 1]
   [2 3]]
   [[4 5]
   [6 7]]
  A.max 3
  A.min
  A.sum 22
 B.min(axis=1)
: array([4, 6])
 B.cumsum(axis=1)
: array([[ 4, 9],
         [ 6, 13]], dtype=int32)
```

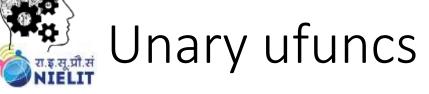

Universal Functions

- NumPy provides familiar mathematical functions such as sin, cos, and exp. In NumPy, these are called "universal functions" (ufunc).
- Within NumPy, these functions operate elementwise on an array, producing an array as output.

```
np.sqrt(A)
array([[ 0.
       [ 1.41421356, 1.73205081]])
np.exp(A)
array([[
                       2.71828183],
         7.3890561 ,
                      20.08553692]])
np.add(A,B)
array([[ 4, 6],
       [ 8, 10]])
```

NumPy

Universal functions

Function	Description	
abs, fabs	Compute the absolute value element-wise for integer, floating-point, or complex values	
sqrt	Compute the square root of each element (equivalent to arr ** 0.5)	
square	Compute the square of each element (equivalent to arr ** 2)	
exp	Compute the exponent ex of each element	
log, log10,	Natural logarithm (base e), log base 10, log base 2, and log(1 + x), respectively	
log2, log1p		
sign	Compute the sign of each element: 1 (positive), 0 (zero), or -1 (negative)	
ceil	Compute the ceiling of each element (i.e., the smallest integer greater than or equal to that number)	
floor	Compute the floor of each element (i.e., the largest integer less than or equal to each element)	
rint	Round elements to the nearest integer, preserving the dtype	
modf	Return fractional and integral parts of array as a separate array	
isnan	Return boolean array indicating whether each value is NaN (Not a Number)	

Source:

Python for Data Analysis

logical_and,

logical_or, logical_xor

Function	Description
add	Add corresponding elements in arrays
subtract	Subtract elements in second array from first array
multiply	Multiply array elements
divide, floor_divide	Divide or floor divide (truncating the remainder)
power	Raise elements in first array to powers indicated in second array
maximum, fmax	Element-wise maximum; fmax ignores NaN
minimum, fmin	Element-wise minimum; fmin ignores NaN
mod	Element-wise modulus (remainder of division)
copysign	Copy sign of values in second argument to values in first argument
greater, greater_equal,	Perform element-wise comparison, yielding boolean array (equivalent to in
less, less_equal, equal, not_equal	operators >, >=, <, <=, ==, !=)

& |, ^)

Compute element-wise truth value of logical operation (equivalent to infix operators

NumPy

- shape
- reshape () resize an array.
- Itemsize length of each element of array in bytes.

```
A = np.arange(24)
print(A)
[0 1 2 3 4 5 6 7 8 9 10 1
B= A.reshape(2,3,4)
print(B)
[[[0 1 2 3]
 [4 5 6 7]
 [8 9 10 11]]
[[12 13 14 15]
 [16 17 18 19]
 [20 21 22 23]]]
```

```
A = np.array([[1,2,3],[4,5,6]])
print(A)

[[1 2 3]
  [4 5 6]]

B = A.reshape(3,2)
print(B)

[[1 2]
  [3 4]
```

[5 6]]

 The dots (...) represent as many colons as needed to produce a complete indexing tuple.

```
print(B)
                          B[1,\ldots]
                          array([[12, 13, 14, 15],
[[[ 0 1 2 3]
                                 [16, 17, 18, 19],
 [4 5 6 7]
                                 [20, 21, 22, 23]])
  [8 9 10 11]]

print(b)
[[1. 4.]]
[5. 0.]]
[[ 3. 1.]
[ 0. 1.]]
np.hstack((a,b))
array([[1., 4., 3., 1.],
      [5., 0., 0., 1.]])
np.vstack((a,b))
array([[ 1., 4.],
      [5., 0.],
      [ 3., 1.],
      [ 0., 1.]])
```

Array arithmetic

```
x = np.arange(4)
print("x = ", x)
print("x + 5 = ", x + 5)
print("x - 5 = ", x - 5)
print("x * 2 =", x * 2)
print("x / 2 = ", x / 2)
print("x // 2 =", x // 2) # floor division
X = [0 1 2 3]
x + 5 = [5 6 7 8]
x - 5 = [-5 - 4 - 3 - 2]
x * 2 = [0 2 4 6]
x / 2 = [0. 0.5 1. 1.5]
x // 2 = [0 0 1 1]
print("-x = ", -x)  # unary ufunc for negation
print("x ** 2 = ", x ** 2)  # ** operator for exponentiation
print("x % 2 = ", x % 2) # % operator for modulus
-x = [0 -1 -2 -3]
x ** 2 = [0 1 4 9]
x \% 2 = [0 1 0 1]
```

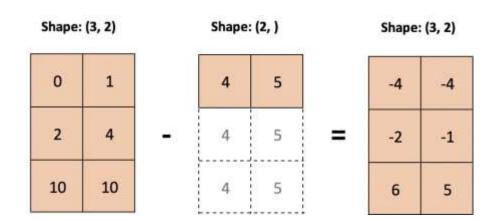

sarwan@NIELIT 20

Broadcasting

 Broadcasting refers to the ability of NumPy to treat arrays of different shapes during arithmetic operations. Arithmetic operations on arrays are usually done on corresponding elements.

```
NumPy
```

```
A= np.arange(12).reshape(4,3)
print(A)
  9 10 11]]
```

```
B = np.arange(5,8)
print(B)
```

[5 6 7]

A+B

```
array([[5, 7, 9],
       [ 8, 10, 12],
       [11, 13, 15],
       [14, 16, 18]])
```

Computation using numpy

```
import numpy as np
np.random.seed(0)
def compute reciprocals(values):
    output = np.empty(len(values))
    for i in range(len(values)):
        output[i] = 1.0/values[i]
    return output
values = np.random.randint(1,10, size=5)
print(values)
[6 1 4 4 8]
print(compute reciprocals(values))
0.16666667 1.
                          0.25
                                      0.25
                                                  0.125
```

```
%timeit compute_reciprocals(values)
